
Question
can an LLM write the weights of a cheap scoring net that improves a gold-standard OR algorithm?
Column generation
VRPTW
(XTW, 34 inst.)
arc / label / ng nets
no gain: exact pricing dominates; net ties the expert rule
MILP branching
4 synthetic classes
(SCIP, Gasse settings)
gain on independent set (0.37× time); hand-written ≥ trained on same features
MIPLIB 2017
39 instances,
rule unchanged
loses overall (19 vs 24 solved): rule is family-specific
Application
MARTA driver scheduling
native C plugin,
SCIP defaults
0.63× time vs default, but plain pseudo-cost does the same
