

Set partitioning (run-cutting): $\min \sum_d c_d\, y_d$ s.t. $\sum_{d \ni t} y_d = 1 \quad \forall$ trips t, $\quad y_d \in \{0,1\}$, $\quad c_d$ = fixed driver cost + paid minutes (+ split / tripper penalties).
Rows, blocks, times and terminals come from MARTA's public GTFS; labour rules and garage grouping are synthetic.
